aviation week space technology: *Absent Aviators* Dr Albert J. Mills, Dr Donna Bridges, Dr Jane Neal-Smith, 2014-09-28 The objective of this book is to present a number of related chapters on the

subject of gender issues in the workplace of the aviation industry. More specifically, the chapters address the continuing shortfall in the number of women pilots in both civilian and military aviation. Considerable research has been carried out on gender issues in the workplace and, for example, women represent about 10% of employees in engineering. This example is often used to show that the consequences of gender discrimination are embedded and difficult to overcome in masculine-dominated occupations. However, women represent only 5-6% of the profession of pilot. Clearly there are many factors which mitigate women seeking to become pilots. The chapters within this volume raise both theoretical and practical issues, endeavouring to address the imbalance of women pilots in this occupation. Absent Aviators consolidates a diverse range of issues from a number of authors from Australia, Austria, the United States, Canada, South Africa and the United Kingdom. Each of the chapters is research-based and aims to present a broad picture of gender issues in aviation, gendered workplaces and sociology, underpinned by sound theoretical perspectives and methodologies. One chapter additionally raises issues on the historical exclusion of race from an airline. The book will prove to be a valuable contribution to the debates on women in masculine-oriented occupations and a practical guide for the aviation industry to help overcome the looming shortfall of pilots. It is also hoped it will directly encourage young women to identify and overcome the barriers to becoming a civilian or military pilot.

aviation week space technology: The Hunt for Zero Point Nick Cook, 2007-12-18 This riveting work of investigative reporting and history exposes classified government projects to build gravity-defying aircraft--which have an uncanny resemblance to flying saucers. The atomic bomb was not the only project to occupy government scientists in the 1940s. Antigravity technology, originally spearheaded by scientists in Nazi Germany, was another high priority, one that still may be in effect today. Now for the first time, a reporter with an unprecedented access to key sources in the intelligence and military communities reveals suppressed evidence that tells the story of a quest for a discovery that could prove as powerful as the A-bomb. The Hunt for Zero Point explores the scientific speculation that a zero point of gravity exists in the universe and can be replicated here on Earth. The pressure to be the first nation to harness gravity is immense, as it means having the ability to build military planes of unlimited speed and range, along with the most deadly weaponry the world has ever seen. The ideal shape for a gravity-defying vehicle happens to be a perfect disk, making antigravity tests a possible explanation for the numerous UFO sightings of the past 50 years. Chronicling the origins of antigravity research in the world's most advanced research facility, which was operated by the Third Reich during World War II, The Hunt for Zero Point traces U.S. involvement in the project, beginning with the recruitment of former Nazi scientists after the war. Drawn from interviews with those involved with the research and who visited labs in Europe and the United States, The Hunt for Zero Point journeys to the heart of the twentieth century's most puzzling unexplained phenomena.

aviation week space technology: Space Systems Failures David M. Harland, Ralph Lorenz, 2007-09-14 The very first book on space systems failures written from an engineering perspective. Focuses on the causes of the failures and discusses how the engineering knowledge base has been enhanced by the lessons learned. Discusses non-fatal anomalies which do not affect the ultimate success of a mission, but which are failures nevertheless. Describes engineering aspects of the

spacecraft, making this a valuable complementary reference work to conventional engineering texts.

aviation week space technology: *Air Power Against Terror* Benjamin S. Lambeth, 2005 The terrorist attacks of 9/11 plunged the United States into a determined counteroffensive against Osama bin Laden and his al Qaeda terrorist network. This report details the initial U.S. military response to those attacks, namely, the destruction of al Qaeda's terrorist infrastructure and the removal of the ruling Taliban regime in Afghanistan. The author emphasizes several distinctive achievements in this war, including the use of precision air-delivered weapons that were effective irrespective of weather, the first combat use of Predator unmanned aerial vehicles armed with Hellfire missiles, and the integrated employment of high-altitude drones and other air- and space-based sensors that gave CENTCOM unprecedented round-the-clock awareness of enemy activity.

aviation week space technology: Airports, Cities, and the Jet Age Janet R. Bednarek, 2016-08-31 This book explores the relationship between cities and their commercial airports. These vital transportation facilities are locally owned and managed and civic leaders and boosters have made them central to often expansive economic development dreams, including the construction of architecturally significant buildings. However, other metropolitan residents have paid a high price for the expansion of air transportation, as battles over jet aircraft noise resulted not only in quieter jet engine technologies, but profound changes in the metropolitan landscape with the clearance of both urban and suburban neighborhoods. And in the wake of 9/11, the US commercial airport has emerged as the place where Americans most fully experience the security regime introduced after those terrorist attacks.

aviation week space technology: Airbus Industrie S. McGuire, 1997-08-13 This book examines an event that never happened - a trade war between the US and the EC in respect of the civil aircraft builder, Airbus Industrie. By understanding this trade dispute, the author casts light on broader issues of international cooperation by focusing on the bilateral trade negotiations that took place between 1979 and 1992. He considers the role played by aerospace firms, the GATT and the transatlantic alliance in shaping this cooperative outcome.

aviation week space technology: The General Aviation Industry in America Donald M. Pattillo, 2020-03-09 The industry known as general aviation--encompassing all flying outside of the military and commercial airlines--dates from the early days of powered flight. As technology advanced, making possible smaller aircraft that could be owned and operated by civilians, manufacturers emerged to a serve a growing market. Increasingly this meant business flying, as companies used aircraft in a variety of roles. The industry struggled during the Great Depression but development continued; small aircraft manufacturers became vital to the massive military production effort during World War II. After the war, rapid technological advancement and a robust, prosperous middle class were expected to result in a democratized civil aviation industry. For many reasons this was never realized, even as general aviation roles and aircraft capabilities expanded. Despite its many reverses and struggles, entrepreneurship has remained the driving factor of the industry.

aviation week space technology: *Winning in Asia, European Style* V. Aggarwal, 2016-05-24 Despite the regional currency crisis of 1997-1998, Asia-Pacific economies continue to be among the most attractive markets in the world. Although Japanese and American firms have invested heavily in the past decades, European firms are poised to take advantage of the post-Asian recovery, phenomenal Chinese growth rates, and deepening economic liberalization. This volume focuses on understanding the market and nonmarket strategies employed by European firms to boost their share of the Asian market and to rally European governments and the European Union in support of their initiatives. In addition to a novel theoretical framework to analyze strategy, three chapters focus on investment trends in Asia, lobbying in Asia and the EU, the book includes original case studies of the air transport, automobile, software, and finance sectors.

aviation week space technology: *The Global Commercial Aviation Industry* Sören Eriksson, Harm-Jan Steenhuis, 2015-07-16 This book provides a state-of-the-art overview of the changes and development of the civil international aircraft/aviation industry. It offers a fully up-to-date account of the international developments and structure in the aircraft and aviation industries from a number of perspectives, which include economic, geographical, political and technological points of view. The aircraft industry is characterized by very complex, high technology products produced in relatively small quantities. The high-technology requirements necessitate a high level of R&D. In no other industry is it more of inter-dependence and cross-fertilisation of advanced technology. Consequently, most of the world’s large aircraft companies and technology leaders have been located in Europe and North America. During the last few decades many developing countries have tried to build up an internationally competitive aircraft industry. The authors study a number of important issues including the political economy of the aircraft industry, globalization in this industry, innovation, newly industrializing economies and the aircraft industry. This book also explores regional and large aircraft, transformation of the aviation industry in Central and Eastern Europe, including engines, airlines, airports and airline safety. It will be of great value to students and to researchers seeking information on the aircraft industry and its development in different regions.

aviation week space technology: *Space Wars* Michael J. Coumatos, William B. Scott, William J. Birnes, 2007-04-17 Michael J. Coumatos is a former U.S. Navy test pilot, ship's captain, and commodore; U.S. Space Command director of wargaming; and a government counterterrorism advisor. William Scott is a retired bureau chief of Aviation Week and Space Technology and a nine-year Air force veteran who served as aircrew on nuclear sampling missions. He is a six-time Royal Aeronautical Society Journalist of the Year finalist, and won the Society's 1998 Lockheed Martin Award for the Best Defense Submission. He also received both the 2006 and 2007 Messier-Dowty awards for Best Airshow Submission. With the help of New York Times bestselling author William J. Birnes, these renowned experts have joined forces to grippingly depict how the first hours of World War III might play out in the year 2010. Coumatos, Scott, and Birnes take the reader inside U.S. Strategic Command, where top military commanders, space-company executives, and U.S. intelligence experts are conducting a DEADSATS II wargame, exploring how the loss of critical satellites could lead to nuclear war. The players don't know that the war they are gaming has already begun, miles above them in the lifeless, silent cold of space. Jam-packed with the actual systems and secret technologies the United States has or will soon field to protect its space assets, Space Wars describes a near-future nuclear nightmare that terrorists will relish but politicians prefer to ignore. In a quieter, more peaceful time, Space Wars would be an exciting work of fiction. But with the United States now at war, Space Wars is all too real. . aviation week space technology: NATO's Air War for Kosovo Benjamin S. Lambeth, 2001-11-16 This book offers a thorough appraisal of Operation Allied Force, NATO's 78-day air war to compel the president of Yugoslavia, Slobodan Milosevic, to end his campaign of ethnic cleansing in Kosovo. The author sheds light both on the operation's strengths and on its most salient weaknesses. He outlines the key highlights of the air war and examines the various factors that interacted to induce Milosevic to capitulate when he did. He then explores air power's most critical accomplishments in Operation Allied Force as well as the problems that hindered the operation both in its planning and in its execution. Finally, he assesses Operation Allied Force from a political and strategic perspective, calling attention to those issues that are likely to have the greatest bearing on future military policymaking. The book concludes that the air war, although by no means the only factor responsible for the allies' victory, certainly set the stage for Milosevic's surrender by making it clear that he had little to gain by holding out. It concludes that in the end, Operation Allied Force's most noteworthy distinction may lie in the fact that the allies prevailed despite the myriad impediments they faced.

aviation week space technology: Technology Transfer Dietrich Schroeer, Micro Elena, 2018-02-06 This title was first published in 2000: The theme of this collection of essays is technology transfer. The topic has three major aspects: the interchange of technologies between military and civilian applications - spin-off, dual use, conversion and diversification fall under this heading; the proliferation of military arms, which could occur either through arms races between developed nations or through the transfer of military technology from developed arms industries to less developed nations - proliferation, arms races and arms control agreements fall under this heading; and the transfer of civilian technologies from developing nations to less developed nations. The expression, North-South transfer and the idea of development come under this final section. The essays offer examination of all three aspects.

aviation week space technology: On the Edge of Earth Steven Lambakis, 2014-04-23 “Interesting and provocative. . . . Recommended for anyone interested in space policy and national security affairs.” —Choice The United States has long exploited Earth’s orbits to enhance security, generate wealth, and solidify its position as a world leader. America’s ambivalence toward military activities in space, however, has the potential to undermine our future security. Some perceive space as a place to defend and fight for America’s vital interests. Others?whose voices are frequently dominant and manifested in public rhetoric, funded defense programs, international diplomacy, and treaty commitments?look upon space as a preserve not to be despoiled by earthly strife. After forty years of discussion, the debate over America’s role in space rages on. In light of the steady increase in international satellite activity for commercial and military purposes, America’s vacillation on this issue could begin to pose a real threat to our national security. Steven Lambakis argues that this policy dysfunction will eventually manifest itself in diminished international political leverage, the forfeiture of technological advances, and the squandering of valuable financial resources. Lambakis reviews key political, military, and business developments in space over the past four decades. Emphasizing that we should not take our unobstructed and unlimited access to space for granted, he identifies potential space threats and policy flaws and proposes steps to meet national security demands for the twenty-first century. “Provides a wealth of details on a wide range of factors that contribute to space power.” —Air & Space Power Journal “Will trigger public debate, generate controversy and add creatively to the policy debate.” —John D. Stempel, author of Common Sense and Foreign Policy

aviation week space technology: The Militarization and Weaponization of Space Matthew Mowthorpe, 2004 The militarization of space began as a rivalry between the United States and the Soviet Union and grew to enormous proportions during the height of the Cold War. Satellite reconnaissance, navigation and weapons guidance, and electronic intelligence comprise only a few of the efforts taken to militarize and dominate space. Today as the prominence of information

technology, computing, and telecommunications advances, so does the concept of space as a battlefield. In The Militarization and Weaponization of Space, Matthew Mowthorpe diligently analyzes the military space policies of the United States, the Soviet Union/Russia, and the People's Republic of China from the Cold War period to the present day. Mowthorpe focuses on the development of the ballistic missile defense and other anti-satellite systems and aptly assesses to what degree space will become armed. This work cogently addresses an issue of increasing urgency to scholars of international politics.
